KIM JULONGBAYAN

Python Developer | Web Scraping, ETL and Data Quality
Quezon City, Metro Manila, Philippines | kljulongbayan@gmail.com | +63 961 529 9305
Portfolio: kimlj.dev | GitHub: github.com/kimlj | LinkedIn: linkedin.com/in/kimjulongbayan

PROFESSIONAL SUMMARY

- Developer with 3 years of professional software development experience. Builds unattended Python data pipelines and production database applications, with practical work in multi-source collection, company-name normalization, duplicate detection and data quality checks.
- Portfolio and interactive demos: https://kimlj.dev/hub | Code: https://github.com/kimlj/jobsift

TECHNICAL SKILLS

- Python and extraction: Python, httpx, BeautifulSoup, JSON, CSV, IMAP, basic PDF text extraction with pypdf; Playwright for end-to-end browser testing.
- Data and integration: PostgreSQL, Supabase, SQLite, SQL migrations, REST APIs, Google Sheets API, structured LLM extraction, normalization and deduplication.
- Operations: Linux VPS, Docker, systemd, Git, GitHub Actions, pytest, scheduled workflows, logging, backups and documented rollback procedures.

EXPERIENCE

MDS Pro Solutions - Full Stack Developer (Contract) | Feb 2026 - Present

- Sole engineer on a production timekeeping and billing platform used every workday by 15 people. Works directly with the owner to translate operational rules into software.
- Designed and maintains the Supabase/Postgres database, with 49 SQL migrations and 41 row-level access policies recorded in the migrations.
- Automated billing into Google Sheets. The sync fills blank cells and reports mismatches without overwriting staff entries; reporting checks recompute totals from source records.
- Generates payroll and client-invoice workbooks from one shared calculation. Built read-only AI querying across Postgres and Sheets, with a row cap and cost tracking.

PROJECTS

Jobsift - Automated Collection and Processing Pipeline | Python, BeautifulSoup, SQLite

- Collects listings from board APIs, HTML pages and email alerts, then normalizes, filters, enriches and stores them through one shared pipeline. Rebuilt from an earlier n8n workflow.
- Matches records across boards using normalized company names and titles. Uses a URL fallback when an employer is missing, with a versioned migration preserving older duplicate keys.
- Stores source identifiers, posting URLs, collection timestamps and structured records. Schedules source refreshes and exports results to Google Sheets and CSV.
- Runs continuously on a Linux VPS. Tests cover malicious URLs and prompt injection; database transfers use checksum checks, with daily local copies and written rollback steps.
- Uses BeautifulSoup for HTML extraction and pypdf for basic PDF text ingestion. Keeps extraction, drafting and claim verification separate so each stage checks different evidence.

Jarvis - Personal Data Integration | Private project | Python

- Built an async Python router joining three existing stores over REST, including 2.6 million location points and a photo library of about 40,000 items. Storage products are open source.
- Checked imported media dates against their manifest, excluded virtual activities with misleading GPS, and improved long-query search by combining results from shorter searches.

SendIt - Semantic Matching | In development | Python, FastAPI

- Built OpenAI embedding and cosine-similarity matching, caching results in Supabase so unchanged text is not embedded again. Uses Pydantic models for structured output validation.

Shift Ops Console - Workflow Integration Demonstrator

- Built n8n rules and Make digest routing with Google Sheets, Slack and Looker Studio for a simulated workforce, with approval decisions recorded through Power Automate.

EDUCATION

- BS Information Technology coursework, AMA Computer College Makati. Completed 3 of 4 years; degree not conferred.
