

KIM JULONGBAYAN

AI Agent Engineer | Claude Code, MCP and Agent Tooling | Automation and Integrations

Quezon City, Metro Manila, Philippines | kljulongbayan@gmail.com | +63 961 529 9305

Portfolio: kimlj.dev | GitHub: github.com/kimlj | LinkedIn: linkedin.com/in/kimjulongbayan

Professional Summary

- AI and automation developer, 5+ years building software end to end and 3+ years on LLM integration. Sole engineer on a production platform 15 people use every workday, reporting to a non-technical owner in the US: I build it, document it in plain language, and train the people who operate it.
- 772 hours and 16,252 prompts in Claude Code across 43 projects (149 active days, Oct 2025 - Sep 2026), counted from session transcripts and published at kimlj.dev. Authored 20 Claude Code skills (~6,000 lines) and 4 subagents with scoped tool permissions.

Technical Skills

- AI agents and tooling: Claude Code as primary environment, MCP servers and connectors in daily use (Claude in Chrome, Gmail, Google Calendar, Vercel), agents on the Anthropic SDK with custom tools, authored skills and subagents, prompt-injection handling, per-question token and cost accounting
- Automation platforms: n8n (self-hosted), Make, Zapier, Power Automate, Google Apps Script, Looker Studio
- Integrations: Google Sheets API over a service-account OAuth2 JWT flow, Gmail over IMAP, Resend email API with SPF/DKIM/MX, Telegram Bot API, Slack alerts, REST APIs, webhooks, scheduled jobs
- Browser and device automation: Playwright (CI-gated end-to-end suite of my own; cross-browser visual regression in recharts), published Chrome MV3 extensions in production, Android emulator fleets scripted over adb, HTTP scraping across three job boards
- Languages and data: Python, TypeScript, JavaScript, Node.js and Fastify | PostgreSQL, Supabase, Postgres RLS, SQLite
- Infrastructure: Linux VPS (DigitalOcean), Caddy, Nginx, Docker, PM2, scheduled jobs, Git, CI/CD, nightly encrypted off-site backups, secrets and blast-radius inventory

Experience

MDS Pro Solutions - Full Stack Developer (Contract) | Jun 2026 - Present

- Sole engineer on the internal timekeeping and billing platform (TypeScript, Fastify, Supabase/Postgres, Chrome MV3 extension) used every workday by 15 people: nurses working remotely across the Philippines, and the owner in the US.
- Built "Ask AI", an agent on the Anthropic SDK with two custom tools: `run_sql` against a SELECT-only Postgres role in a read-only transaction under a 500-row cap, and `read_sheet` over the Sheets API, so the owner asks "how many hours did Lindsey work last Monday" in plain English and gets real numbers back. Per-question token and cost tracking, and an executor hardened across three migrations.
- Integrated client billing into the owner's Google Sheet over a hand-rolled service-account OAuth2 JWT flow: a scheduled sync fills only blank cells and reports mismatches rather than overwriting typed figures, so what the client typed survives.
- Run the deployment and the documentation: API on a DigitalOcean droplet behind Caddy, dashboard on Vercel, extension in the Chrome Web Store, nightly encrypted off-site dumps, a secrets inventory naming each key's blast radius, and the runbooks the owner works from, walked through with him at each rollout.

Independent AI and Automation Developer | 2018 - Present

- WordWarz.io, built and run end to end: a sub-100ms Socket.IO backend on a Dockerised Linux VPS behind Nginx, 570 players across 1,045 matches.
- Took that game's client from zero automated tests to a CI-gated Playwright suite: two browser contexts play a real match against a server on a throwaway database, testing the release build with one variable changed. Its first layout test corrected a blocker the plan had read off the code instead of running.

Projects

Jobsift - Multi-Role Agent Pipeline for Job Discovery and Drafting | Python, Claude and OpenAI APIs

- Split drafting into four agent roles so one can check another: an extractor that never sees the candidate, a drafter that must list every factual claim it makes, a verifier run per claim in parallel that sees only the claim and the evidence, and a supervisor that loops unsupported claims back for redrafting. Postings are untrusted input: injection attempts are recorded rather than obeyed.

Shift Ops Console - Multi-Platform Automation and Compliance Rules Engine | n8n, Make, Zapier, Power Automate

- Split one compliance pipeline across six platforms by fit - n8n rules engine, Apps Script generator, Make digest and routing, Power Automate approvals, Zapier Slack alerts, Looker Studio dashboards - over a jurisdiction-keyed rules table for 100 people across 9 timezones.
- Measured the detector rather than asserting it: 370 planted anomalies, 359 caught, 97.0% on 7 Sep 2026, and the scoring then proved its own false-positive figure wrong, 9% to 1.0%.

Open Source

- 4 pull requests merged into maintained open-source projects in 2026, maintainer-reviewed: mastra, the TypeScript agent framework (honouring Retry-After on model-call retries instead of retrying into a rate limit), and recharts (3, one with regenerated Playwright cross-browser snapshots).

Education

- Bachelor of Science in Information Technology, AMA Computer College Makati (3 of 4 years completed)
