

# KIM JULONGBAYAN

Software Developer | AI-Assisted Development | QA and Test Automation

Quezon City, Metro Manila, Philippines | kljulongbayan@gmail.com | +63 961 529 9305  
Portfolio: kimlj.dev | GitHub: github.com/kimlj | LinkedIn: linkedin.com/in/kimjulongbayan

## PROFESSIONAL SUMMARY

---

- Software developer with 5+ years building end to end, now building with Claude Code and Codex every day and testing what they produce. Sole engineer on a production platform 15 people use every workday.
- 834 hours and 17,512 prompts in Claude Code across 48 projects (168 active days, as of Sep 2026), counted from session transcripts and published at kimlj.dev.

## TECHNICAL SKILLS

---

- AI coding tools: Claude Code, Codex, Claude API, OpenAI API; reviewing AI-written changes before they ship
- Testing and QA: Playwright end-to-end tests in GitHub Actions, visual regression baselines, bug reproduction with control runs, regression checks, hostile-input testing
- Languages and data: TypeScript, JavaScript, Python | PostgreSQL, Supabase, row-level security, SQLite | REST APIs, webhooks
- Infrastructure: Linux VPS (Ubuntu, systemd), Docker, Nginx, Vercel, Git, GitHub Actions, backups and rollback

## EXPERIENCE

---

### MDS Pro Solutions - Full Stack Developer (Contract) | Feb 2026 - Present

- Sole engineer on the internal timekeeping and billing platform (TypeScript, Fastify, Supabase/Postgres, Chrome extension) used every workday by 15 people, from remote nurses in the Philippines to the owner in the US.
- Found and closed a database access hole that let any signed-in nurse read every colleague's billed rate, on a path the server's admin check never saw. 46 migrations carry 40 row-level access rules.
- Replaced an editable payroll spreadsheet: clock-ins are stamped by the database, records are append-only, and every correction goes through an approved, attributed trail. Nightly encrypted off-site backups.
- Ask AI on the Claude API: answers plain questions about the data through a read-only database account capped at 500 rows, with the cost of each question recorded.

### Independent Developer | 2018 - Present

- Built and shipped web, mobile and automation systems end to end: architecture, development, testing, deployment and maintenance.

## PROJECTS

---

### WordWarz.io - Real-Time Multiplayer Game | React, Node.js, Socket.IO

- Playwright suite that starts the game server and the release build, plays a real match across two browsers, and runs in GitHub Actions on every change beside 584 server tests.
- Live on the web, the App Store and Google Play: 570 players have reached a game across 1,045 matches, with 40 to 70 playing on a given day, grown by word of mouth.

### Jobsift - Self-Hosted Job Pipeline | Python, Linux

- Runs 24/7 on an Ubuntu server as a system service, with a home laptop as a second worker kept alive by a watchdog. Live database moved behind a checksum check, backed up daily with rollback steps.
- {'Security tested on purpose': 'link fetcher attacked with 23 hostile addresses, AI step with six hijacking postings. Found a bot token in the logs, rotated it and closed the leak.'}

### Open Source | GitHub

- 5 pull requests merged into recharts and mastra (27,000+ stars each), each reviewed by a maintainer, including a reproducing case and regenerated visual regression baselines.
- Traced a Windows bug in OpenAI's Codex CLI (127,000+ stars) to two source lines with a control run, then showed the first fix missed a case. The maintainer credited the trace; the shipped fix changed those lines.

## EDUCATION

---

- Bachelor of Science in Information Technology, AMA Computer College Makati (3 of 4 years completed)
