

KIM JULONGBAYAN

Full Stack Developer | Web and Mobile Testing | Test Automation (Playwright)

Quezon City, Metro Manila, Philippines | kljulongbayan@gmail.com | +63 961 529 9305

Portfolio: kimlj.dev | GitHub: github.com/kimlj | LinkedIn: linkedin.com/in/kimjulongbayan

PROFESSIONAL SUMMARY

- Developer who tests what he ships, across a production web platform used every workday by 15 people and a web and iOS game with 40 to 70 players on a given day.
- Finds where software fails at each layer: a database permission hole the server never saw, a Windows bug traced to two lines of OpenAI's Codex source, a scorer that overstated its own error rate.

TECHNICAL SKILLS

- Testing: Playwright end-to-end and visual-regression tests, Vitest, API and security testing with hostile inputs, Android emulators over adb, iOS App Store releases
- SQL: PostgreSQL, Supabase, 46 schema migrations, row-level security | REST APIs, WebSockets
- JavaScript, TypeScript, Python | React, Capacitor, Chrome MV3 | Node.js, Express, Fastify, Socket.IO
- Git, GitHub Actions, Codemagic, Docker, Linux VPS, Nginx | Google Sheets API, Apps Script

EXPERIENCE

MDS Pro Solutions - Full Stack Developer (Contract) | February 2026 - Present

- Sole engineer on the timekeeping, payroll and billing platform a US nurse staffing company runs on, used every workday by 15 people: TypeScript, Fastify, Supabase/Postgres, and the Chrome extension nurses clock in with.
- Found and closed a permission hole that let any signed-in nurse read every colleague's billed rate by calling the database API directly, on a path the server's admin check never saw.
- Billing sync into the owner's Google Sheet fills only blank cells and reports mismatches for a person to decide, instead of overwriting typed figures.
- Timesheet, payroll and invoice workbooks come from one shared pay calculation, so every surface agrees to the cent; nightly encrypted off-site backups.
- An AI assistant answers the owner's questions with SELECT-only SQL: a read-only database role, capped at 500 rows, with the cost of each question recorded.

Independent Full Stack Developer | 2018 – Present

- Built REST APIs and real-time systems; optimized database queries and backend performance.

PROJECTS

WordWarz.io - Real-Time Multiplayer Web and iOS Game | React, Capacitor, Node.js, Socket.IO

- Plays in the browser and as a native iOS app on the App Store, Android build in review; 570 players have reached a game across 1,045 matches, with 40 to 70 playing on a given day.
- Wrote its Playwright suite: boots the game server on a throwaway database and the release build, then plays a real match across two browsers, beside 584 server tests.
- Android emulator script (470 lines over adb): creates, boots, installs, launches, screenshots and pulls logs.

Jobsift - Self-Hosted Job Alert Pipeline | Python, SQLite, Linux

- Runs 24/7 on a Linux server; tested its link fetcher with 23 hostile URLs and its AI step with six prompt-injection postings.
- Traced a five-day silent failure in the server logs to the AI provider's credits running out, and moved the AI calls to another provider.

Shift Ops Console - Anomaly Detection on Simulated Data

- Caught 359 of 370 planted anomalies, then found my own scorer was wrong and rebuilt it, cutting the reported false-positive rate from 9% to 1.0%.

OPEN SOURCE AND BUG REPORTS

- OpenAI Codex (127,000+ GitHub stars): traced a Windows focus-stealing bug to two process-launch lines, retested the first fix and showed it missed that case; the maintainer credited the trace.
- recharts, a charting library with over 27,000 GitHub stars (4 merged, 2026): axis sizing and a stacked-chart bug, with regenerated visual-regression baselines. Each reviewed by a maintainer.
- mastra, an AI agent framework with over 27,000 GitHub stars (1 merged): model-call retries now honor Retry-After.

EDUCATION

- Bachelor of Science in Information Technology, AMA Computer College Makati (3 of 4 years completed)
