

KIM JULONGBAYAN

AI Automation Engineer | Agents on Claude and OpenAI | Python, Node and REST Integrations

Quezon City, Metro Manila, Philippines | kljulongbayan@gmail.com | +63 961 529 9305

Portfolio: kimlj.dev | GitHub: github.com/kimlj | LinkedIn: linkedin.com/in/kimjulongbayan

PROFESSIONAL SUMMARY

- Automation engineer who connects tools that were never meant to talk to each other, then keeps them running: workflows across n8n, Make, Zapier and Power Automate, AI agents on the Claude and OpenAI APIs, and the Python and Node code in between. I document what I build so a team can run it without me.
- 776 hours and 16,365 prompts in Claude Code across 43 projects (150 active days, as of Sep 2026), counted from session transcripts and published at kimlj.dev.

TECHNICAL SKILLS

- Automation and workflows: n8n (self-hosted), Make, Zapier, Microsoft Power Automate, Google Apps Script, Looker Studio, scheduled jobs, webhooks, multi-step conditional routing
- AI agents: Claude API and OpenAI GPT-4o, tool use, prompt engineering, agents that check each other's work, structured and checkable output, cost and token tracking on every call
- Integrations: REST APIs, webhooks, Google Workspace (Sheets, Gmail, Apps Script), Slack alerts, Telegram Bot API, Supabase, OAuth, third-party APIs behind rate limits
- Languages and data: Python, JavaScript, TypeScript, SQL; PostgreSQL, MySQL, SQLite, schema design and versioned migrations
- Running what I build: error handling and retries, Sentry crash reporting, Docker on a Linux VPS behind Nginx, CI/CD, Git and GitHub, written handover documentation

EXPERIENCE

MDS Pro Solutions - Full Stack Developer (Contract) | Jun 2026 - Present

- Built an AI feature into the product on the Claude API: staff ask a question in plain English, the model turns it into a database query, and a locked-down account runs it that can only ever read. Every answer records what it cost.
- Automated billing that used to be typed by hand, syncing into the owner's Google Sheet on a schedule. It fills blank cells only and reports mismatches, so it can never overwrite a figure a person entered.
- Sole engineer on a platform 15 people use every workday, and the one who keeps it up: deployment, monitoring, backups and the documentation.
- Wrote the handover documentation the same way: what each part does, what breaks it, and what to check first, so the work does not depend on me being reachable.

Independent Automation and AI Developer | 2018 - Present

- Built and shipped automation and AI systems end to end for my own products and for others, including the integration work, the deployment and the handover notes.

SELECTED AUTOMATIONS

Shift-Ops Console - One Rules Engine Across Six Platforms

- A system that flags attendance and compliance problems across a simulated 100-person workforce, split over six tools on purpose: n8n runs the rules, Make sends the daily summary, Zapier fires urgent Slack alerts, Power Automate handles approve and reject, Apps Script feeds the data, Looker Studio draws the dashboards.
- Then I tested it honestly. I planted 370 problems and counted how many it found: 359, or 97 percent. The test also showed I had been counting wrong, which was the more useful discovery.

Jobsift - An n8n Workflow Rebuilt as a Python Service

- Started as an n8n workflow with GPT-4o, hit the limits of n8n, and became a Python program. It reads sources directly where they allow it and email where they do not, and throws out obvious misfits before spending anything on an AI call.
- It runs unattended on a schedule, retries what fails, records what every AI call cost, and writes its results to a spreadsheet and a Slack-style alert so a person can see what happened without reading logs.

EDUCATION

- Bachelor of Science in Information Technology, AMA Computer College Makati (3 of 4 years completed)
