

# KIM JULONGBAYAN

AI Developer and Automation Engineer | OpenAI and Claude APIs | Python and API Integration

Quezon City, Metro Manila, Philippines | kljulongbayan@gmail.com | +63 961 529 9305

Portfolio: kimlj.dev | GitHub: github.com/kimlj | LinkedIn: linkedin.com/in/kimjulongbayan

## PROFESSIONAL SUMMARY

---

- AI and automation developer with 5+ years building software end to end and 3+ years integrating LLM APIs into products people use. Sole engineer on a production platform 15 people run their work on every day. I build on existing APIs, databases and calculation engines rather than rebuilding them.
- 776 hours and 16,365 prompts in Claude Code across 43 projects (150 active days, as of Sep 2026), counted from session transcripts and published at kimlj.dev.

## TECHNICAL SKILLS

---

- AI APIs and agents: Claude API, OpenAI GPT-4o, prompt engineering, structured output against pydantic schemas, multi-agent verification loops, per-question token and cost accounting
- Python: FastAPI, httpx, pydantic, BeautifulSoup and lxml, PyPDF2, python-docx, numpy, packaging, scheduled jobs
- Automation platforms and workflows: n8n, Microsoft Power Automate, Zapier, Make, Google Apps Script, Looker Studio, REST APIs, webhooks, Chrome MV3 extensions
- Databases and document processing: PostgreSQL, Supabase, Postgres RLS, SQLite, Google Sheets API, PDF and DOCX parsing, ExcelJS and XLSX report generation
- Infrastructure: Docker, Linux VPS, Nginx, Google Cloud, Vercel, Git, CI/CD

## EXPERIENCE

---

### MDS Pro Solutions - Full Stack Developer (Contract) | Jun 2026 - Present

- Shipped natural-language database querying on the Claude API: the model writes SQL, a dedicated read-only Postgres role executes it under a row cap, and per-question token and cost accounting is recorded beside every answer.
- Generated timesheet, payroll and client-invoice Excel workbooks with ExcelJS from one shared calculation, so no two documents disagree by a cent.
- Automated client billing into the owner's Google Sheet over the Sheets API: a scheduled sync fills blank cells only and reports mismatches, rather than overwriting a figure a person typed.
- Sole engineer on the platform (TypeScript, Fastify, Supabase/Postgres, Chrome MV3 extension), used every workday by 15 people: a nursing team across the Philippines and the owner in the US.

### Independent AI and Automation Developer | 2018 - Present

- Built and shipped AI-integrated web and automation systems end to end: architecture, development, deployment and maintenance.

## PROJECTS

---

### Jobsift - Multi-Agent LLM Pipeline | Python

- Split one LLM call into four roles so that one can check another: an extractor that reads the source document without seeing the candidate, a drafter, a verifier run one parallel call per claim against the trusted sources, and a supervisor that sends unsupported claims back for a bounded redraft.
- Hard filters run before enrichment and scoring, so a rejected item never costs an LLM call. SQLite store, Google Sheets archive, Telegram alerts above threshold.

### SendIt - FastAPI Document and LLM Service | Python

- FastAPI and Supabase backend that parses uploaded PDF and DOCX with PyPDF2 and python-docx, integrates around 17 external sources behind a shared base class and rate limiter, and returns structured LLM output against pydantic schemas with XLSX export.

### Shift-Ops Console - Accuracy Harness Over Six Automation Platforms | n8n, Power Automate, Zapier, Make

- Built one rules engine across six platforms, then measured it against ground truth rather than trusting it: 370 planted anomalies, 359 caught, 97.0% (7 Sep 2026). The harness also caught its own scorer being wrong, where two kinds of planted row shared a denominator.

## EDUCATION

---

- Bachelor of Science in Information Technology, AMA Computer College Makati (3 of 4 years completed)
