

KIM JULONGBAYAN

Full-Stack Engineer | Takes Half-Built Products to Live | TypeScript, React, Supabase

Quezon City, Metro Manila, Philippines | kljulongbayan@gmail.com | +63 961 529 9305

Portfolio: kimlj.dev | GitHub: github.com/kimlj | LinkedIn: linkedin.com/in/kimjulongbayan

PROFESSIONAL SUMMARY

- I finish things. Most of my work is taking something that runs on one machine and making it survive real users: finding what is broken before they do, cutting what does not need to ship, and getting it deployed. I work in Claude Code every day and it is how I move this fast.
- 776 hours and 16,365 prompts in Claude Code across 43 projects (150 active days, as of Sep 2026), counted from session transcripts and published at kimlj.dev.

TECHNICAL SKILLS

- AI coding tools: Claude Code daily, at the measured hours above, plus 21 custom skills and 4 subagents I wrote to keep its output correct on my own repositories, and MCP servers in daily use
- Front end: React, Next.js, Vite, Tailwind CSS, TypeScript, JavaScript, responsive and mobile-first layouts
- Back end and data: Node, Fastify, Express, Python and FastAPI, REST APIs, webhooks, Supabase and PostgreSQL, SQLite
- Shipping: Vercel, Netlify, Docker on a Linux VPS with Nginx, Git and GitHub, CI/CD, environment and secret handling, Sentry crash reporting
- Finding what is broken: automated tests that run on every push, end-to-end browser tests, edge cases and error states, and security review of my own work

EXPERIENCE

MDS Pro Solutions - Full Stack Developer (Contract) | Jun 2026 - Present

- Sole engineer on the platform 15 people use every workday. I decide what gets built, build it, deploy it and keep it running: TypeScript and Fastify over Supabase Postgres, plus a published Chrome extension.
- Found and closed a hole that let any signed-in nurse read every colleague's pay rate, on a path the server's own permission check never covered. It was live, and nobody had noticed.
- Replaced an editable payroll spreadsheet with records that cannot be quietly changed, because the spreadsheet was the actual bug.
- Push back when the ask is wrong. The payroll fix was smaller than what was requested, because the request would have preserved the bug in a nicer wrapper.

Independent Developer | 2018 - Present

- Shipped WordWarz.io to the iOS App Store: 570 players have reached a game across 1,045 matches, 40 to 70 on a given day, grown by word of mouth alone.
- Merged fixes into other people's codebases: three pull requests into recharts and one into mastra, both around 27,000 stars, with one reviewed by a maintainer before it landed. Reading unfamiliar code is most of that work.
- Deploy and keep the plumbing in order myself: Vercel and Netlify for web, Docker on a Linux VPS for the rest, with environments, keys and repositories kept separate and documented.

SELECTED WORK

Jobsift - My Own Half-Working Workflow, Finished

- It began as an n8n workflow that worked when I ran it and broke when I did not. I rebuilt it as a Python program with real error handling, tests, and filters that throw out obvious misfits before spending anything on an AI call. It now runs on a schedule without me watching it.

WordWarz.io - Hardening Something Already Live

- Took a shipped app from no automated tests to a suite that runs on every push, including a real two-player match and phone, tablet and desktop layouts checked automatically.
- The useful part was deciding what not to test. I covered the paths a real player takes and left the rest, because a suite nobody trusts is worse than a small one that runs.

EDUCATION

- Bachelor of Science in Information Technology, AMA Computer College Makati (3 of 4 years completed)
