KIM JULONGBAYAN

AI Automation and Application Security | Python, TypeScript, Linux

Quezon City, Metro Manila, Philippines | kljulongbayan@gmail.com | +63 961 529 9305
Portfolio: kimlj.dev | GitHub: github.com/kimlj | LinkedIn: linkedin.com/in/kimjulongbayan

PROFESSIONAL SUMMARY

- Developer with 3 years of professional software development experience and over a year of hands-on AI work. Owns production software, integrations, security fixes and operations.
- Security work includes database access controls, hostile-URL checks, prompt-injection test cases and restricted AI tool access. Portfolio and demos at kimlj.dev/hub.

TECHNICAL SKILLS

- Development: Python, TypeScript, JavaScript, Bash, SQL, REST APIs, Git, GitHub Actions
- AI: Claude Code, Anthropic SDK, OpenAI API, tool-using agents, independent review workflows
- Security: Postgres access policies, least-privilege roles, SSRF defenses, DNS validation, TLS, input validation, prompt-injection testing
- Operations: Ubuntu, Docker, systemd, SSH, Caddy-hosted services, monitoring, encrypted backups

EXPERIENCE

MDS Pro Solutions - Full Stack Developer (Contract) | Feb 2026 - Present

- Sole engineer on the TypeScript and Postgres timekeeping and billing platform used every workday by 15 people across a Philippine team and US owner.
- Closed a database access-control hole exposing colleagues' billing rates through direct requests that bypassed the API's admin guard.
- Built an Anthropic SDK agent whose SQL tool runs with a SELECT-only role, read-only transactions and a 500-row cap; hardened execution permissions across migrations.
- Maintain append-only time records, attributed correction trails and encrypted off-site backups for a system handling sensitive patient information.
- Shipped 48 SQL migrations, with access policies enforced in Postgres so permissions apply to direct database requests as well as the API.

PROJECTS

Jobsift - Secure Job Automation Pipeline | Python, SQLite, APIs

- Built the fetcher with HTTPS-only requests, public-address validation, DNS-rebinding defenses and redirect-by-redirect checks; security cases cover 23 hostile URLs.
- Added six hostile-posting cases to check prompt-injection handling while preserving legitimate application instructions.
- Separated extraction, drafting and per-claim verification; run pytest checks in GitHub Actions. Public source at github.com/kimlj/jobsift.
- Hardened the Docker deployment with a non-root user, read-only filesystem, dropped capabilities and resource limits, keeping data outside the image.
- Found a Telegram token leaking into HTTP-client logs, rotated it and reduced that logger's verbosity to prevent the same exposure recurring.

Cockpit - Agent Development Workspace | DeepSeek Harness

- Built a milestone workflow with an implementation agent, automated checks, independent read-only review and human approval before a git checkpoint.
- Not public yet; live walkthrough and commit history available. Claude Code made the film at kimlj.dev/cockpit.

Production Monitoring and Backup Checks | Python, Monit, Linux

- Monitor services, public TLS expiry, app errors, unusual admin sign-ins and backup freshness; send incident, reminder and recovery notifications.
- Verify database dumps are readable before counting backups as successful, then retain encrypted off-site copies.

EDUCATION

- BS Information Technology, AMA Computer College Makati (3 of 4 years completed)
