

KIM JULONGBAYAN

React Native and Expo Developer | iOS App Live on the App Store | TypeScript
Quezon City, Metro Manila, Philippines | kljulongbayan@gmail.com | +63 961 529 9305
Portfolio: kimlj.dev | GitHub: github.com/kimlj | LinkedIn: linkedin.com/in/kimjulongbayan

PROFESSIONAL SUMMARY

- Mobile and full stack developer who ships. My game WordWarz.io is live on the iOS App Store: I built the app, the real-time backend and the UI, and did the TestFlight and App Store submission myself. 5+ years building, and I work in TypeScript daily.
- 776 hours and 16,365 prompts in Claude Code across 43 projects (150 active days, as of Sep 2026), counted from session transcripts and published at kimlj.dev.

TECHNICAL SKILLS

- Mobile: React Native, Expo (SDK 54), TypeScript, React Navigation, Reanimated, Zustand, Capacitor, iOS and Android builds, TestFlight and App Store submission
- Front end: React, Next.js, Vite, Tailwind CSS, mobile-first and responsive layouts, matching a design closely
- Backend for an MVP: Supabase (Postgres, Auth, realtime), Node and Fastify, REST APIs, Socket.IO for live updates, SQLite
- Sign-in: Supabase Auth with Apple and Google sign-in, JWT sessions, per-user access rules so people only see their own data
- Ways of working: Git and GitHub, CI/CD, automated tests that run on every push, Sentry for crash reporting, Claude Code daily

EXPERIENCE

WordWarz.io - Creator and Sole Developer | Live on the iOS App Store

- Built and shipped a real-time multiplayer word game end to end: the mobile app, accounts and sign-in, the live game server over Socket.IO, and the App Store submission. React and Capacitor over Node.
- 570 players have reached a game across 1,045 multiplayer matches, with 40 to 70 playing on a given day, grown by word of mouth alone.
- Took it from no automated tests to a suite that runs on every push, including a real two-player match and phone, tablet and desktop layouts checked automatically.
- Spent the time on the details that make an app feel finished rather than merely working: safe areas, keyboard behavior, haptics and transitions matched across phone sizes.
- Ran the whole release path myself: automated build pipelines, TestFlight for testers, then App Store review and the updates after it.
- Scripted an Android emulator fleet to test releases across screen sizes: create, boot, install, launch, screenshot and pull logs, so a build could be checked on many devices without a drawer full of phones.

MDS Pro Solutions - Full Stack Developer (Contract) | Jun 2026 - Present

- Sole engineer on the platform 15 people use every workday: TypeScript and Fastify APIs over Supabase Postgres, and a published Chrome extension. I decide how things get built and then build them.
- Built the sign-in and the permission rules, so each person sees only their own records, and ran the deployment and monitoring myself.
- Built the live view, where everyone's status updates on screen the moment it changes rather than on a refresh. That is the same problem as showing who has said yes to a plan.

PROJECTS

DailyLoad - React Native and Expo Fitness App (personal, private repo)

- Built on the current stack: Expo 54, React Native 0.81, TypeScript 5.9, React Navigation, Reanimated, Zustand, local SQLite storage and Apple HealthKit. Nine screens including onboarding, across 64 TypeScript files.
- Local-first: the app stores its own data on the device and reads Apple Health, so it works with no network and no account, which is a different set of problems from a server-backed app.

EDUCATION

- Bachelor of Science in Information Technology, AMA Computer College Makati (3 of 4 years completed)
